Missouri's Old Reliable Seed House

1884

Our 69th Year

1953

As one of the oldest seed houses in the United States, we have been serving the farmers and gardeners of the Middle West since 1884. We are proud of this record and thankful to our many friends for their confidence and patronage throughout the years.

As this is written, we at Archias are looking forward to spring and the time when your orders come rolling in. We are constantly improving our facilities to render a better service. Our new warehouse and cleaning plant is now in operation. New cleaning machinery, seed treaters, etc., have been installed all to give you better seeds and to help us fill your order more promptly.

Let us know your wants early and often during the season, and if it's so you can, drive to our store this spring and make your selections in person; if not, of course, the same good service will be given your mail orders.

Again let us say "thank you" and we're waiting to hear from you.

Cordially yours,
L. H. Archias, Jr., President

We give no other or further warranty, expressed or implied.

Archias' Nursery Stock Guarantee

Our nursery stock is carefully handled and full of vitality, under ordinary conditions should grow for you, but if it does not, we will replace it at one-half price the next season if you notify us before July 15th.

Archias' Hybrid TOMATOES

Advantages of Hybrid Tomatoes

It has been proven that true hybrids grow faster than open pollinated varieties, produce greater yields, show more vigor, and bear a more uniform product over a longer period of time. It is possible to incorporate into hybrids, disease resistance, the best feature of their parents, and to eliminate many of the bad features. If you want uniform fruit, extra yield, and better quality, we highly recommend the hybrid varieties listed below. The proper use of fertilizer in your soil is essential with hybrids as well as with other varieties.

U. S. 13

Main Crop Yellow—120-125 days

A grand hybrid in every way and very popular throughout the Corn belt. Single ear tendency. Deep kernels high in feeding value. Resistance to drought and chinch bug. Shucks easily. Stands up well.

Missouri 8

Main Crop Yellow—120-125 days

Developed by Mo. Agricultural College. In use for 8 years. In 6-year trials in Missouri, outyielded Reid's Yellow Dent 36 per cent. A smooth, yellow Corn, not flinty, prolific, tending to two or more good ears on fair soil and in good season. Big-rooted, strong-stalked, making it drought and wind resistant. Is also disease resistant. Dark green foliage.

MISSOURI 148

120-125 days

Missouri 148 parentage is similar to Missouri 8; however, in breeding this new hybrid the undesirable features of Missouri 8 have been removed, retaining the good features and many of the good features of U. S. 13 have been added.

A very tall hybrid with deep green foliage. Ears borne high, are long and somewhat tapering. Kernels medium yellow with medium indentation. Resistant to lodging under most conditions. Best adapted to the area south of the Missouri river. No. 148 was near the top in many of the state yield tests.

on orders for two bushels or more of Hybrid Seed Corn anywhere if you order early!

3 Outstanding White Hybrids

U. S. 523W "State Certified." A new white hybrid recommended by the University as adapted for southern and central Missouri and adjoining states to the South. May also be planted in the Northern region providing planting is reasonably early. About the same maturity as Missouri 8 and Kansas 2234. An excellent yielder with good standability and husk color. Grain type and quality suitable for milling purposes. Mostly single eared, resistant to Corn ear worm, grasshoppers, and chinchbugs. It is a top producing hybrid in Missouri.

Funk's G-777W This white hybrid has made an outstanding record over a wide area of Missouri and Kansas. Medium stalks of excellent quality carry the ears about waist high. Good on both upland and bottom soils; has done very well on light soils. Sound grain, wide kernels with top milling quality. G-777W is a medium late white Corn that yields with the better yellow varieties.

Funk's G-512W is a dependable deepkerneled White Corn on all-white cobs. Medium to medium late maturity in Kansas and Missouri. Strong stalks hold their large ears at just the right height for good picking. A high yielder that adapts itself well to either high or low fertility soils.

New! To Replace U. S. 13 KANSAS 1639

Kansas 1639 is a midseason yellow hybrid just slightly later than U. S. 13. Especially well adapted to northern and central Missouri where it has exceeded U. S. 13 in yield.

Kansas 1639 is similar in height to U. S. 13, ears borne lower on the stalk. Better stalk lodging resistance, drops fewer ears, has better husk cover, is more drought-resistant than U. S. 13.

Kansas 1639 has a very good appearance and should be liked by farmers who are looking for an improved U. S. 13.

It matures in about 110 days and is one of the highest yielding open-pollinated varieties available today.

Reid's Yellow Dent

Early Red Snowcap

The earliest red Corn of all. Matures in 80 to 85 days. Kernels are of a bright cherry-red color, with yellowish cap—the result of a cross between a Red Flint and Yellow Dent. This Corn often matures in less than 80 days. See the farm seed price list for prices.

Midland Yellow Dent

A medium late maturing Yellow Corn, requiring normally 130 days to mature. The stalk is large compared with Reid's Yellow Dent. The ears average 7½ to 9½ inches long. Medium large in circumference, has a medium large cob. This variety is noted for its heavy yield and for its freedom from root rot diseases. Very few damaged ears.

90-Day Yellow

A quick growing yellow variety, highly desirable and popular with feeders who want an early feeding Corn. Matures in about 90 days. Archias' 90-Day Yellow ears are about 10 inches long, sometimes two to the stalk; deep, moderately rough kernels high in protein and oil content make it an excellent feeding Corn.

HICKORY KING

The white grain is so wide and deep, and the cob so small that often a single grain will cover the end of a broken cob. It has been called the Poor Man's Corn because it can be depended upon to produce a crop on poor, thin land. On good land it bears 2 ears to the stalk. By mail, postpaid, 1 lb., 35c; 3 lbs., 90c. ALSIKE Clover

Grows Where Other Clovers Fail

Alsike does well on low, wet, heavy soil where Red Clover, Sweet Clover and Alfalfa can't take it.

Alsike hay is high in protein, and fully equals Red Clover in feeding value. Does fine planted along with Timothy, Tall Fescue, or any other good grasses. Alsike seed being small, requires only 6 to 10 pounds per acre. Our Alsike is hardy, northern grown, the very finest quality, dark, green berry, free of noxious seeds. It pays to plant the best. See Farm Seed price list for price.

SWEET Clover

Surpasses all crops in soil building qualities. Stores large quantities of nitrogen in the soil, increases fertility and humus. A valuable pasture crop.

White Blossom Sweet Clover.

Yellow Blossom Sweet Clover.

Unhulled Sweet Clover. (White Blossoms.)

Hubam, Annual Sweet Clover.

Madrid, New Yellow.

ALFALFA

Archias' northern and native grown Alfalfa deserves to rank first among legumes. Extremely deep rooted, withstands drought as well as severe winters. It furnishes more green foliage, more pasture and dry hay per acre than any known variety of hay or grass. Plant Adapted Seed—approved for AAA payments, same money and get dependable seed by buying your Alfalfa from Archias.

MILLET SEED

Sow 30 to 40 pounds to the acre

GOLDEN or HAY MILLET. It is sown in the spring, and after harvesting leaves the ground in the finest condition for Wheat.

PROSO MILLET. Also known as Hog Millet. Grown almost exclusively for seed, yielding up to 60 to 70 bushels per acre. Excellent poultry feed. Needs warm weather and soil for quick germination. Sow 40 to 50 lbs. to the acre. Drill in close rows or broadcast.

TALL OR KENTUCKY "31" FESCUE

Discovered growing many years ago on a mountain farm in Kentucky, hence its name. A perennial bunch grass, puts out blades in great number. Is best suited as a permanent pasture since it improves with age, building up a heavy, dense sod, prevents erosion, produces a large amount of succulent pasture the year around. Grows anywhere but the better the soil, the better the grass. Sow in middle August, September or early spring months. We offer the very finest strain, free of noxious weeds and rye grass. See Farm Seed price list for prices.

ALTA FESCUE New Wonder Grass.

There's nothing like it. Heavy yielding wonder grass lives 20 years or more, is highly palatable, a summer producer, soil builder and weed eradicator.

Alta Fescue produces as much or more fall and winter foliage as other grasses adapted solely to those seasons. Produces more summer foliage than all but the strictly summer-growing grasses. High feeding value and palatability. Rapid recovery after pasture. Wide adaptability to soils, climate, and moisture. See Field Seed list for prices.

ALTA "144" FESCUE

"Certified" Blue Tag

A somewhat softer leaf than regular Alta. Considered by many the most valuable of all the Fescues yet developed. This softer leaf is maintained throughout the entire growing period, making it ideal for pasture. Available stocks are still scarce. See Farm Seed Price List for prices.

MO. 0-205 OATS

New! Outstanding Variety

Developed at the Missouri Agricultural Experiment Station from the cross Columbia Victoria-Richland. 0-205 outstanding characteristics are its high yield and test weight, strong straw and disease resistance. The kernels are striped like Columbia, with thin hulls. The strong straw is anchored by a vigorous root system, important in reducing the lodging from rain and wind storms.

MO. 0-205 LEADS IN PRODUCTION

Over a wide area throughout the corn belt in tests conducted the past four years, including extensive tests in Missouri, 0-205 has *led all named varieties* grown in the cooperative nurseries making these tests.

0-205 DISEASE RESISTANT

This variety is particularly fortunate to be resistant to smuts, victoria blight and the common races of crown and stem rusts, including the new race 45. Of all the new oats varieties, 0-205 is the only variety adapted to Missouri with this excellent combination of resistance.

0-205 SUPPLY LIMITED

We are fortunate in having several thousand bushels of State Certified, as well as Grower Affidavit, Seed to offer. However they will not last long, so place your orders early.

State Certified

Sacked 3 bushels to the bag. Sealed with Mo. Crop. Impr. Assn. Seals. Please order in multiples of 3 bushels. See Field Seed List for prices.

Grower Affidavit

Grown from Certified or Foundation seed by Mo. Growers, and carrying Growers Affidavit as to genuineness of variety. You'll find the quality of these Oats tops, but priced lower than Certified. See Field Seed List for prices.

Other Top-Yielding "Certified" Oats

ANDREW State "Certified"—our most popular new Oat of the Bond Crosses. A fine yield record, wide adaptation, resistant to most rusts, smut and blight. Recommended for any area in Missouri—early—does best on poor to average soil.

CHEROKEE Preferred for its early maturing habit. Plump and compact kernels—on strong, stiff straw. Cherokee does well in Kansas and most sections of Missouri. While it is of the same crosses as Clinton it is a better Oat.

NEMAHA Highly resistant to disease. It is an exceptionally heavy yielder of plump, high testing grain. Straw is heavy and strong—2 to 5 days earlier than Clinton. We offer only Certified Seed.

Archias' "CHEMICAL-COATED" SEEDS

EXTRA CROP INSURANCE AT VERY LITTLE COST — ORDER ALL YOUR FARM SEED "CHEMICAL-COATED"

The greatest development in Farm Seed history. Experiment Stations have, after much research, found seed treatment beneficial to small legumes and grasses as it has been for seed corn. Our "Chemical Coated" process is the very latest—using the newest, improved Slurry Treators—for uniform, dust free, safe coverage. The coating material, DuPont's latest development with growth stimulant added, is highly effective in destroying the growth of fungi responsible for seed decay and damping-off and root rots—the coating protects the seed and seedlings during the period of germination and emergence. This means better stands—healthier plants and more profitable yields. This extra crop insurance costs very little, especially when used on your higher priced seeds.

LOW COST OF THIS SERVICE

Because "Chemical Coating" is new, and we want you to decide whether to use it or not, we do not price our Farm Seeds (with few exceptions) with this treatment applied, but give you the cost separately. To find the cost of "Chemical Coating" add the following to your order for treatment. Because we sell only the very highest quality Farm Seed, we

FAMOUS KY. "31" FESCUE at New Low Prices

GENUINE STATE "CERTIFIED" FREE OF NOXIOUS WEEDS

Ky. "31" Fescue is heavy yielding, deep rooted, long lived, excellent for permanent pastures, forming dense sods in one year that hold livestock up in wet weather. In the Southern area it produces the year around, except in extreme cold. It grows fastest in early spring and late fall while native grasses are dormant. It has the longest pasture season, furnishing more grazing per year than other grasses and stand more cold, heat, water, drought, acid, alkali, shade, or rough treatment. It is adapted to practically all climates and soils, dry, sandy or rocky hillsides to wet, heavy bottoms. Excellent to stop erosion. It does best on heavy, well-fertilized soils with abundant moisture. Sow 20 lbs. per acre in the spring or early fall or 10 lbs. with 1 to 2 lbs. of Ladino Clover.

**Plant in abundance at
less than half of last
season's cost! See our

REED CANARY GRASS

**4 to 6 Tons of Hay Per Acre From
Your Wet Land!**

The hay (of high feeding value) is relished by all livestock. One acre will pasture three to four dairy cows from early spring until fall. Close grazing is best, except in fall. For hay, cut when heads first appear. Then feeding value is highest.

This hardy perennial grass will thrive until broken up, and can be easily controlled by plowing. Seedlings and plants are cold resistant. Heads appear early in June and ripen four weeks later. Plants grow four to six feet high with broad, light green leaves. Underground stems rapidly form a tough sod that holds up hay-making machinery. Sow in early spring.

Broadleaf BIRDSFOOT TREFOIL

A relatively new, deep-rooted legume that is more widely adapted to all sorts of growing conditions than any other legume available. It is becoming more and more popular in the Middle West. It grows well on poor soil, or rich soil—it grows on wet soil, or dry gravelly hills. It responds to fertilizer by increased yields and feeding value.

The plants are perennial, have a deep, wide-branching root system, grow 12 to 30 inches tall, with very fine stems, and stand a lot of tramping and close grazing. It's an ideal legume to use with grasses, for pasture, on lands that are poor in fertility. It is seeded either in spring or early fall, in a well prepared seed bed, at the rate of 4 to 5 pounds per acre. Seed should be inoculated with Nitragin, the same as other legumes.

Extensive tests indicate that Birdsfoot Trefoil is the answer to the demand for a deep-rooted, drought-resistant perennial legume that will stand heavy grazing. The feeding value is equal to other hay or pastures. Be sure to try this new legume for pasture this year. See Farm Seed Price List for prices.

NEW!

Wilt-Resistant

IOWA 6 LESPEDEZA

EARLY — FINE LEAF — HEAVY PRODUCER — DISEASE RESISTANT

The newest introduction in wilt-resistant early Lespedeza. Iowa 6 has proven the most satisfactory Lespedeza grown by many of our seed growers. Iowa 6 starts off very quickly in the spring and is apparently free from bacteria wilt. We find that it grows as tall as any of the early Lespedeza varieties. It has very fine leaves and stem which makes it more desirable for hay. Our growers are harvesting as much as 800 to 1,000 pounds of clean seed to the acre and has proven to be a real money maker. You will hear a lot more about Iowa 6. Be one of the first to grow it. While our supply of seed is limited we can take care of you if you order early. See the Field Seed Price List that came with this catalog for prices.

Early 19604 LESPEDEZA

HAS BEEN KNOWN AS "EARLY GIANT"

Averages 6 Inches Taller—Early Maturing—Heavy Yielding—Drought Resistant

Early "19604" is gaining in popularity each season as more farmers are seeing it grow and seeing what it is doing. The demand for seed is exceeding the supply. Last season we were sold out long before the season was over, and with this year's short supply we know we will be able to supply only the ones that order early. Growth up to two feet has been reported for Early 19604. It will stand lots of hot weather and responds beautifully to moist conditions. It will grow on very poor soil and on better land with fertilizer it will grow taller and heavier. Some say it grows twice as tall as common Lespedeza. It makes an early start in the spring and as a heavy seed producer it's a money-maker all around. Let us have your order early. See the Farm Seed List for prices.

SERICEA THE PERENNIAL LESPEDEZA

Adapted to every type of soil, wonderfully resistant to drought, large yielding crops, good pasture and a fine soil improver.

Like alfalfa, it requires one year to get set, but after the first year it will produce two to four tons of field cured hay per acre annually. Actual feeding trials have proved that Lespedeza Sericea hay is equal to that of alfalfa. Sericea enjoys many advantages over the annual lespedezas. It will thrive on much poorer land, comes back year after year from the roots, furnishes two to three cuttings per season, and yields much more abundantly. During the most severe drought years Sericea, due to its deep, vigorous root system, maintained a beautiful rich green color, when other forage crops were burned up. Sericea is generally at its best during July and August when other forage crops are considerably off.

As stated above, Sericea requires two years' growth before a hay crop can be cut. Many of our customers have obtained excellent results in sowing a mixture of Korean or Iowa 6 with Sericea. By this method you can obtain a hay crop the first year, while the Sericea is becoming established, and the following year the Sericea will predominate in the field and spread from year to year. The use of this mixture is only suggested where the crop is to be used for pasture or cut for hay, for if combined for seed the second year there will be a mixture which is difficult to sell.

KENLAND RED CLOVER

Blue Tag "Certified"

Most sensational Red Clover ever introduced. Bred to produce superior yields. It grows off faster, crowds out weeds, resists cold winters and summer droughts. Stands last longer—out-yields other strains so much that it is recommended by 29 states to be superior. Seed supplies are very limited so order early.

AT LAST! A WAY TO WIPE OUT RATS Has Been Found!

WHY TRAPS HAVE FAILED

Rats often develop a "bait shyness" to baits used in traps . . . besides, traps have proven to be dangerous to use around animals and children . . . thus traps have NEVER been the answer to the rat and mouse problem.

WHY POISONS HAVE FAILED

Rats are smart — just a few bites or smells of an ordinary poison, and rats warn their friends and the rats quit eating. No one wants to use poisons around their valuable animals, and especially their children . . . thus poisons are not the answer to the rat and mouse problem.

WHY d-CON DESTROYS WHOLE COLONIES OF RATS

d-CON is a new "wonder drug" that is tasteless, odorless and depends on cumulative dosages for results . . . thus, rats return for d-CON without any clue as to what is causing their death. Tests PROVE d-CON IS THE MOST EFFECTIVE WAY TO DESTROY RATS AND MICE.

NOW! "Chemical Coated" Farm Seeds

Assure Better Stands

This chemical protection is a special formula of various disinfectants with root growth stimulant added. This kills diseases that affect germination and plant survival and increases root growth.

When the seed is sown during cold, wet weather, newly planted seed is often attacked during the germinating period causing the sprout to die. "Chemical coated" treatment kills these disease organisms, giving the new sprout an opportunity to come through the soil and survive. This is why you get so much larger percentage of plants from "chemical coated" seed.

COST OF THIS TREATMENT

Because many of our customers not being familiar with this new improvement in agriculture still want their seed untreated. Consequently, our price list on most items does not include "Chemical coating." If you are one of the many that prefer your seed to be treated, we are equipped to render this service quickly using the very latest model of slurry treaters, the best known formula at the following reasonable prices. In ordering, mention which lot you want "chemical coated" and add to your order for this service as follows:

Most Clovers, Lespedeza, Alfalfa, Oats, Beans, Sudan and similar size seeds:

\$1.25 per 100 lbs. extra.

Grasses, Timothy, Brome, Orchard, Fescue, Ladino, Red Top and similar seeds:

\$1.75 per 100 lbs. extra.

When coating "certified" seed we must break the seal. Please keep this in mind, when ordering as they cannot be coated in a sealed bag.

BROME GRASS

"The Miracle Drought Resister"

Sow 20 lbs. per acre.

One of the most sensational additions that American agriculture has received in years. It is rather slow the first season, but the second year is great and once established you have it for keeps. It is hardy, permanent, stands the driest of droughts, the hottest summers, and the coldest winters. It is the first green grass in the spring, the last in the fall, and stays green all summer when other grasses are dry. It is very high in feeding value; will carry from 50 to 100 per cent more livestock per acre than Blue Grass. Cut for hay, you will have from three to four tons per acre. All classes of livestock like it as it is very palatable. It is a grass and so cannot poison the stock. Sow either fall or spring, using 15 to 20 lbs. per acre. Have a firm, well packed seed bed, harrow in lightly and roll well if at all possible. Do not cover too deeply—one-fourth to one-half inch is plenty. You can get two crops in a season. Harvest when it is one-third to one-half in bloom. It is easily killed under cultivation if you want to get rid of it. Our Brome Grass is Achenbach (Southern Strain), Native Kansas Strain. 10 lbs., \$5.75, postpaid. See Field Seed List for quantity prices.

Orchard Grass

One of the best long-lived, deep-rooted grasses for year round pasture or hay or to reseed on old Alfalfa sods. It does well on practically every type of soil, including acid soils, thrives in the shade, grows vigorously and produces large crops of nutritious hay relished by all livestock. It recovers quickly when cut or grazed. It grows the year round with maximum growth in the spring and fall. Should be included in every hay or pasture mixture. Sow 14 lbs. per acre with other grasses or 30 to 35 lbs. alone in early spring or fall.

See Farm Seed Price List for quantity prices.

Broom Corn

(Evergreen.) A fine crop for dry land farming where there is a market for the straw for brooms. It has practically no food value. Plant in 3 1/2-foot rows, thinning out to stand 8 to 10 inches in the row and cultivate like Corn. 6 lbs. per acre. 1 lb., 45c; 5 lbs., \$1.75, postpaid. See farm Seed price list for quantity prices.

Reed Canary Seed

On low, wet, poorly drained soils, on thin, eroded hillsides Reed Canary comes through like a champion. It is the lowest priced this year since its introduction. Because of this low price we think more farmers than ever before should sow Reed Canary Grass.

Reed Canary makes wonderful pasture, excellent high yielding hay and once established makes a tough sturdy sod that lasts for years.

See Farm Seed Price List for Prices.

SUDAN GRASS

"Certified" Sweet Sudan Grass

SWEET SUDAN is a greatly improved Sudan Grass from a hybridization of Leota Red Sorghum on common Sudan. It has great palatability, livestock eating it to the ground before touching common Sudan or other forage Sorghums. SWEET SUDAN has broader leaves, larger stems and makes taller growth, stooling heavier than common Sudan. It is a truly great improvement over common Sudan, and in our opinion will completely replace common Sudan in a few years. We recommend that every farmer put in at least a part of his Sudan acreage with SWEET SUDAN to prove to himself the many advantages for both hay and grazing over common Sudan. See Farm Seed Price List for quantity prices.

"Certified" Sudan Grass

Sudan Grass is primarily a hay grass, its slender leafy stems making it easy to handle with ordinary haying machinery. It makes its greatest growth and produces the most feed during July, August and September, when native grasses are less productive. It can be grown successfully on almost every class of soil from a heavy clay to a light sand, besides being particularly drought and heat resistant. Primarily an excellent hay crop, Sudan is gaining in popularity as a summer pasture. Ready to cut in 45 days. Sow after the ground becomes thoroughly warm, preferably broadcast at the rate of 20 to 25 pounds per acre. A grain drill may be used, set to sow two pecks of Wheat. Cut when in bloom, for at that stage the feeding value is highest. See Farm Seed Price List for quantity prices.

SOIL-SOAKER

Lawn Weeds and Crab Grass

When Zotox is applied in the minimum solution it kills crab grass without destroying permanent lawn grasses. The selective action is attributed to the fact that crab grass has broader leaves and absorbs more of the chemical than do the narrow-leaved turf grasses. Being a shallow-rooted annual also makes crab grass less resistant to Zotox than are the deep-rooted perennial grasses. Zotox is sold in four convenient sizes. 8 ozs., \$1.00; 16 ozs., \$1.50; 32 ozs., \$2.50; 5 lbs., \$4.50.

An 8-oz. bottle treats 1000 to 2000 square feet.

A Drink Of This Makes Plants Kill Insects

Insects which prey on plants can be killed by applying insecticide to the soil. Most successful example is found in sodium selenate, which florists have used for several years, on greenhouse flowers. Tiny insects which infest African violets and other house plants disappear when it is applied to the soil in which they grow. Sodium selenate is a poison, and should be used with caution. Do not apply it to food plants of any kind. To insure safety when used with house plants we offer it in capsules, each containing a safe but effective dose for an average pot.
